

WMS Executive Summary

System overview for leadership and panel review

1. What the System Is

WMS is an integrated operations platform for meat-processing workflows, built in-house. It is implemented on open-source architecture, making it practical to tweak and extend across modules. It unifies slaughter weighing, production processing, inter-department transfers (IDT), receiving, despatch, and reporting into one governed system.

2.1 Core Technology Stack

- Backend: PHP with Laravel framework.
- Frontend: Vanilla JavaScript with jQuery on Blade-rendered pages.
- Data layer: Structured relational database model for transactional integrity and reporting.

3. Business Value Delivered

- Single source of operational truth across departments.
- Real-time, scale-driven data capture to reduce manual errors.
- Controlled stock and transfer movement with issue, receive, and approval paths.
- Faster management reporting through downloadable line and summary exports.
- Improved auditability through timestamped records and role-based workflows.

4. Core Functional Coverage

Production Domains

- Slaughter and carcass classification
- Butchery (beheading, breaking, deboning)
- Spices and chopping (batch and lines)
- Sausage and beef/lamb flows

Movement and Control

- IDT issue and receiving
- Highcare and despatch transfer operations
- Variance and approval handling
- Stock and asset movement support

5. Integrations at a Glance

- LDAP/domain authentication API integration for enterprise user sign-in (domain credentials).
- Scale integrations with configurable COM-port/IP endpoint settings.
- API interfaces for inbound/outbound production and slaughter data exchange.

- Excel/CSV reporting exports for business and ERP handoff use cases.
- Messaging capability via RabbitMQ for event-based integration patterns.
- Support integrations for SMS notifications and operational log visibility.

6. Governance and Reliability

- Authenticated web workflows with LDAP/domain-backed login integration.
- Token-protected and rate-limited external API endpoints.
- Validation and rule-driven transaction posting.
- Cached lookups and configuration refresh controls for performance and consistency.

7. Executive Conclusion

WMS provides an end-to-end digital backbone for production execution and transfer accountability. It combines operational speed, data integrity, and integration readiness, giving management a reliable platform for day-to-day control and strategic reporting.
